Setting up Media Player as a Media Server (Windows only)

Laura - 2021-10-19 - Media Streaming und Flow server

The PC on which you have audio you want to share must be located on the same network as your Pure Internet radio.

Your Flow internet radio must be connected to your local wireless network

The audio media you want to serve must be in a file format your radio can play. To check supported formats visit the article 'Supported formats and bit rates'

Below are instructions for Windows Media Player 12 and Windows Media Player 11

Windows Media Player 12

Start Windows Media Player, click "Stream" and click on "Turn on media streaming"

O Windows Medi	a Player				
File View Play	Tools Help				
30 + Lit	orary 🕨 Music 🕨 All music				
Organize 👻 Si	tream 👻 Create playlist 👻				
	Allow Internet access to home media	Title			
echsup;	Allow remote control of my Player				
 Playlists test2 	Automatically allow devices to play my media	I WOULD RATHER GO B			
▶ test	Turn on media streaming				
⊳ 🞝 Music	2013				
Videos					
Pictures					

Then click on "Turn on media streaming" (see below)

Choose media streaming options for computers and devices

	ng allows you to send your music, pictures and videos to other computers and devices rk. It also allows you to receive media from other computers and devices.
	media streaming, your current network profile and firewall settings will be modified. In on media streaming only on networks that you trust, such as home or work
Turn on me	edia streaming

Please Note: If this option has already been enabled, you will need click on More Streaming options...

You now need to click "Allow all", however, you can specify individual devices if you wish.

Now click on **Customize** (see image below) alongside each device and on the following screen, select **Make all of the media In my library available to this device** before clicking **OK**.

Locating and indexing your music

When you set up a media server you need to tell the server the location of the media you want served. Telling the media server the location of your music will allow the server to start a process called **indexing**. Indexing allows a server to scan the entire contents of what is to be served and build its own internal library of the locations of each individual file. This helps the server quickly find the individual files you request when you start using the server.

Windows Media Player server will automatically look for, and index, any music files in the default **My Music** folder found in your **My Documents folder**. If you have your music collection in this folder then you don't need to tell the server where it is and the process of indexing will have already started. However if you have your music stored in a different folder then you will need to tell your server where that music is located so it can index and serve it.

The default setting will be folders located in **My Documents** - which contain all the '**My**' folders – including **My Music**. If you want to add other locations you need to click on:

File > Manage Libraries > Music to locate the relevant paths to your locations. (as seen

in below)

View Play Tools Help							
Open	Ctrl+O						
Open URL	Ctrl+U						
Save as							
Close	Ctrl+W	Title					
Create playlist	Ctrl+N	53				E)	
Create auto playlist		Music	Videos	Pictures	Recorded TV	Other media	Playlists
Save Now Playing list							
Save Now Playing list as							
Manage libraries	•	Music					
Properties		Videos					
Work offline		Pictures					
		Recorded TV					
Exit							

Please note: If your Menu bar is not visible in the player, please right click in the area denoted by the arrow and click on **Show menu bar** for these additional options.

🁌 Music l	ibrary Locations		×		
Change how this library gathers its contents When you include a folder in a library, the files appear in the library, but continue to be stored in their original locations.					
Library lo	cations		\frown		
	My Music	Default save location	Add		
	Public Music C:\Users\Public\Music		Remove		

This will open a new dialogue window (shown above) and allow you to manage the **Music Library Locations**. You will now need to click on the **Add** button to add other locations of stored music content. Once you have located your chosen folder, left click with your mouse until highlighted, before finally selecting **Include Folde**r and then **OK**.

Library locations My Music Default save location Public Music Remove C:\Users\Public\Music Remove Music Tracks C:\Users\Desktop\Music Tracks Learn more about libraries OK

You are now ready to stream your content to your Internet radio.

On your radio select the **Media Player** source and your radio will start automatically scanning for new servers available on the same network. If it doesn't scan or you have already performed a scan, then you can instruct the radio to search for new servers by pressing **Options > Media Player Settings > Media Server > Scan For Servers.**

You should now see the name of your server select this and you will see all your content, you can now select and play.

Media server doesn't work?

Media serving is pretty basic in principle but there are a number of factors that can prevent the successful set-up of any media server, and that tends to be security software. Do consider that a default install or 'clean' install of a Windows or MAC OS system - before any 3rd party software is introduced - will always result in successful media serving. It tends to be the later addition of 3rd party software that can interfere with this process. If you are having difficulties setting up your media sever then start with our troubleshooting notes found <u>here</u>

You can find out more about using Windows Media Player 12 as a media server from Microsoft: <u>http://www.microsoft.com/windows/windowsmedia/player/faq/sharing.mspx</u>

Windows Media Player 11

Setting up any type of server consists of a few fundamental steps. You need server software (in this case we have Windows Media Player), you'll need to give the server a name, you'll need to tell the server what you want to serve, and you'll need to tell the server the location of what you want to serve. Start Windows Media Player and click the **Library** drop down menu and select **Media Sharing.** Don't worry if your version of Media Player doesn't looks exactly the same; the menu structures will be the same.

Click **Share My Media To**: and click the now highlighted **Settings** button. This is where you can name your server and tell the server what type of media you want to serve. For this music media server I have named my server **My_Server** and I have specified **Music** as the type of media to be served in **My Media Types**, and **All Ratings**.

Click Ok and your media server is now set up.

Locating and indexing your music

When you set up a media server you need to tell the server the location of the media you want served. Telling the media server the location of your music will allow the sever to start a process called 'indexing'. Indexing allows a server to scan the entire contents of what is to be served and build it's own internal library of the locations of each individual file. This helps the server quickly find the individual files you request when you start using the server.

Windows Media Player server will automatically look for, and index, any music files in the default My Music folder found in your My Documents folder. If you have your music collection in this folder then you don't need to tell the server where it is and the process of indexing will have already started. However if you have your music stored in a different folder then you will need to tell your server where that music is located so it can index and serve it.

Click the **Library** drop down menu and click **Add To Library**. The default setting will be My Personal Folders - which include all the 'My' folders found in 'My Documents' - including 'My Music'. If you want to add other locations you need to click **Advanced Options** and add the relevant paths to your locations.

Tip! When setting up a media server you must ensure your media is on the same network and preferably on the local host machine (the same machine that is hosting the server).

Once you have finished, click **OK** and the server can start indexing.

Ok, so you have your media server started, named and you have given it the location of your music you can now see it on your radio and connect to it.

On your radio select the **Media Player** source and your radio will start automatically scanning for new servers available on the same network. If it doesn't scan or you have already performed a scan, then you can instruct the radio to search for new servers by pressing **Options > Media Player Settings > Media Server > Scan For Servers.**

You should now see the name of your server, however selecting your sever for the first time won't give you immediate access as you need to give the server permission for the radio connect.

In Windows Media Player click the **Library** drop down menu and click **Media Sharing**. You will now see a device listed – probably named 'Unknown Device' – that you can 'allow' to connect. Providing there are no other media servers on the same network this unknown device will be your radio. Click the Unknown Device and click **Allow**.

💿 Windows Media Player		x
💽 🔊 Now Playing Library Rip Burn Sync 🏄	Media Guide	
→ Music → Library → Songs → □ → □ → Search > → Playlists → Create Play → Media Sharing → Unititled Pla → Share music, pictures, and video on your network. → Share music, pictures, and video on your network. → Library ↔ Artist ↔ Sharing settings → Songs ↔ Share my media to: Settings	X No items	•
Year Rating USB CF Reader Allow Deny Customize	• items here rate a playlist or <u>v favorites</u> m 'Songs'.	×
How does sharing change firewall settings? OK Cancel Apply AC/DC	Save Playlist	
		2

And that's it! You've instructed your server to allow the radio to access it and you can start streaming music.

Tip! the process if 'indexing' for the first time can make the media server very slow in reposing to requests. Indexing can also take time – depending on how many files there are to be indexed - so when setting up a server and indexing for the first time you should consider leaving the server to complete its index before you trying to access it. Full indexing only needs to be done once so you won't have to wait around again.
